

StormChain Token (STORM) — Whitepaper

We make hard-to-get jobs easy.

StormChain is a blockchain-verified hiring platform for drivers and developers. The **STORM** token is the platform’s reward token: earn it by using the platform, hold it for utility and potential value.

Overview

Total supply	15,000,000 STORM (fixed, no new minting)
Reward pool	60% (9M) to users
Starting rate	~10 tokens per \$3 USDC spent
Model	Smooth decay (rewards decrease as pool is used)

What is STORM?

STORM is a **bonus token** you earn when you spend USDC on the StormChain platform. The more you spend, the more tokens you earn—resume verification, premium subscriptions, or any future product all use the same rule.

Think of it like airline miles or credit card points—except STORM can be traded and may increase in value as more people use the platform.

How You Earn

Tokens are based on how much USDC you spend, not which product you buy. One formula for everything: spend \$X USDC → earn Y tokens (with decay as the pool depletes).

Examples (at current rate, before decay)

- \$3 USDC spent → ~10 tokens
- \$10 USDC spent → ~33 tokens
- Any product, any price: same rule

As more tokens are distributed, the rate decreases (smooth decay). Early spenders earn more tokens per dollar.

Token Distribution

There will only ever be **15 million STORM tokens**. No more can be created. Allocation:

Allocation	Amount	%	Purpose
User Rewards	9,000,000	60%	Earned by users through platform usage
Platform Treasury	3,000,000	20%	Buybacks, partnerships, liquidity
Founders (Vested)	2,000,000	~13%	Team that built the platform
DEX Liquidity	1,000,000	~7%	Initial trading liquidity

User Rewards — Applicants (drivers, devs) earn STORM when they pay in USDC for verification, subscriptions, etc.

Platform Treasury — Used for buybacks, partnerships, runway, and future liquidity.

Founders — 1M STORM each to two founders; 1-year lock, then 2-year vesting (see Founder Commitment below).

DEX Liquidity — Initial pool when trading goes live, funded by platform revenue.

Smooth Decay Rewards

Token rewards are based on **USDC spent**, with a **smooth decay**—inspired by Bitcoin, but fairer. As more tokens are distributed, the rate per dollar decreases gradually.

The formula

$$\text{tokens} = (\text{USDC_spent} \times \text{rate}) \times (\text{remaining} / \text{total})^{0.7}$$

- **rate** $\approx$ 3.33 tokens per *1USDC* at start (e.g. 3 $\rightarrow$ 10 tokens)
- **remaining** = tokens left in the 9M user-reward pool
- **total** = 9,000,000
- **Exponent 0.7** = gradual decay (no sudden halvings)

What this means: Spend *3USDC* $\rightarrow$ 10 tokens at the start. By the time 503 spend $\rightarrow$ ~6 tokens. One rule for any product.

Decay curve (tokens per \$3 USDC spent)

Tokens distributed	% of pool used	Tokens per \$3 USDC
0	0%	10.00
1,000,000	11%	9.21
3,000,000	33%	7.52
4,500,000	50%	6.16
6,000,000	67%	4.63
8,000,000	89%	2.15
8,900,000	99%	0.44

Early Adopter Advantage

The first users earn the most tokens. As more people join, the reward amounts gradually decrease. This rewards early believers and creates urgency to join sooner—but it’s **fair**: the first user and the

hundredth user earn nearly the same amount.

Potential upside: Tokens have no market price until trading is enabled. Once the platform launches DEX liquidity, early token holders could see significant value if the platform grows successfully.

How Token Value Works

Before trading is enabled: Tokens accumulate in your wallet but have no market price. They're like reward points waiting to be redeemed.

When trading launches: The platform uses revenue to create a liquidity pool. This establishes the first real price, and market supply/demand takes over from there.

Revenue-backed model: Unlike speculative tokens, STORM liquidity is funded by actual platform revenue. Every token earned represents real economic activity on the platform.

Who Earns STORM?

Only applicants earn STORM tokens. When employers pay for services (verification, plans, etc.), those tokens go into a **platform fund**—not to the employer.

This keeps things simple for companies (no token accounting) and directs all rewards to the users who actually use the platform.

Platform fund uses

- Surprise bonuses for active users
- “User of the month”—style rewards
- Rewards for employers who do well on StormChain (e.g. discounts)
- Treasury for platform growth
- Future liquidity provisions

For Employers

Employers **don't earn** STORM when they pay for platform services—those tokens go to the platform fund. You always **pay in USDC**.

When token utility is live, employers who **hold STORM** in their wallet get **lower USDC transaction costs** on the platform (e.g. plans, bulk verification). You never pay in STORM—just hold it to qualify for the discount.

Holding (instead of spending tokens at checkout) keeps STORM scarcer and makes company books and taxes simpler: all platform spend stays in USDC.

Why this matters for employers:

- Pay only in USDC—no token accounting; applicants earn the rewards
- Optional: buy and hold STORM on the DEX to get lower USDC fees on plans and bulk verification
- Do well on StormChain and you could get rewards from the platform bucket (e.g. discounts)
- Holding keeps tokens scarce and simplifies taxes and company books

Founder Commitment

The two founders each receive **1 million STORM tokens**. To show commitment, these tokens are locked and vest over time:

Year	Cumulative unlocked	Status
1	0%	Locked
2	50%	Partial
3	100%	Vested

- **Year 1:** Full lock—no transfers
- **Year 2:** First half vests
- **Year 3:** Fully vested

This aligns founder interests with long-term platform success.

Token Utility

Use	Description
Hold	Accumulate tokens before trading goes live
Use	Pay for subscriptions at a discount (e.g. 10% off)
Trade	Once trading is enabled, sell or buy on DEXs
Vote	Have a say in future platform features (governance)

Anti-Gaming Protection

Every STORM token represents real economic activity. Our anti-spam mechanisms ensure fair distribution:

- **Tokens require real USDC payments** — No free claiming or bot farming
- **Smooth decay creates scarcity** — Rewards decrease with each transaction
- **Revenue-backed value** — Liquidity funded by actual platform revenue

Important Notes

- STORM is a **bonus reward**, not a requirement. The platform works fine without it.
- Tokens have **no market price** until trading is enabled.
- Token prices can go up or down once trading begins. This is not financial advice.
- You don't need to understand crypto to use the platform. STORM is just a bonus.
